While operating the Zipper, the user maintains proper posture where the least strain is placed on supporting muscles and ligaments. This keeps bones and joints in the correct alignment, so that muscles are being used properly. Also, the Zipper's unique design prevents the spine from becoming fixed in abnormal positions, preventing fatigue and allowing the body to use less energy. Compared to other like tools on the market, the Zipper causes less strain, backache, muscular pain, and overuse problems on the human body.
